

# Stadium Roof

---

PFEIFER Structures designs, engineers, and installs lightweight structure canopies, roof structures, and ETFE building envelopes for stadiums. We work with industry leading architects, developers, and general contractors to produce some of the most iconic stadiums around the world. The scalability of our structures allows us to work efficiently on buildings from the public school level to professional sports and Olympic stadiums.

At just a fraction of the weight of glass the advanced ETFE, PTFE, and PVC membrane materials we craft our structures from require minimal structural support which allows us to create amazing, fanciful lightweight structures previously unimagined. Our lightweight stadium structures are low maintenance, can be designed to allow filtered daylight, and are sustainable.
